7. View ID renames (Stage 3f)

501 of 545 ids. Obfuscated prefixes replaced with readable ones (lbl->text, pad->button, pic->image, roll->list, seg->tab, inp->input, crest->header, panel->card), the trailing 'Vw' suffix dropped where unambiguous, and source typos fixed. 34 ids inside AdMob / Meta / house-ad native layouts are EXCLUDED - those SDKs bind asset views by reference.

Part 3 - Code

Methods, logic twists, content, cleanup

8. Method and API function renames (Stages 3g / 6)

Every candidate was checked for declarations and overrides first; no platform or library override name was touched.

warmUpMetaAd	prefetchMetaAd	SecretDecoder.s	SecretDecoder.decode

9. Logic twists (Stages 3a / 3h)

Behaviour-preserving rewrites - same output, different construction.

File	Old approach	New approach
SecretDecoder.kt	index loop filling a pre-allocated ByteArray; method named s()	ByteArray(size){} initializer + empty-input fast path; renamed decode()
CallLogViewModel.kt	one when(order) branching filter/sort/group inline; matches() helper; manual lastBucket loop	enum-scoped extensions (accepts / matches / comparator / isChronological); flatMapIndexed against the previous element
ContactListViewModel.kt	when(filter) building byTab, nested query filter, manual lastLetter loop	ContactFilter.accepts + ContactRecord.matches + initial extensions; flatMapIndexed header injection

10. UI restyle (Stage 3i)

Drawable-level only; no layout-structure changes.

Change	Detail	Scope
Corner radii	Bumped one step, applied numeric-descending so a bumped target never re-feeds a later source. Full pills (100dp / _100sdp / _99sdp) left alone.	87 shapes
Hairline borders	1dp @color/outline added after the solid fill on card/tile surfaces that had none (4 already had a stroke and were skipped).	12 shapes
Squircles	oval -> rectangle + corners for the avatar family AND its rings together, so they stay concentric, plus the six tools-grid chips. Dots, rings, glows and orbit decorations stay round.	17 shapes

11. Content rewrite (Stage 4)

18 keys rewritten in a distinct voice and retranslated into all 11 localized files = 216 strings. Verified before/after that no format specifier or escaped newline changed in ANY string in ANY locale.

Key	Old (Callora, en)	New (Numify, en)
onboarding_title	Every caller, named	Know who's calling
onboarding_desc	Unknown numbers get a name, a business and a location the moment they ring.	See the name, company and region behind an unknown number before you pick up.
onboarding_title_2	Silence scam calls	Stop scam calls cold
onboarding_desc_2	Robocalls, scams and telemarketers are flagged and stopped before your phone rings.	Robocalls, fraud attempts and telemarketers are caught and blocked automatically.
onboarding_title_3	Look up any number	Search any number
onboarding_desc_3	Type a number and get the name, carrier region and business behind it in seconds.	Enter any digits and get back the owner, network region and business in seconds.
onboarding_get_started	Start now	Get started
exit_dialog_title	Exit app?	Leave Numify?
exit_dialog_desc	Are you sure you want to exit?	You can always come back - your blocklist stays saved.
perm_calllog_message	Callora needs call log access to list the calls you have made and received.	Numify reads your call log so recent calls appear here with names attached.
perm_contacts_message	Callora needs contacts access to label calls with the names you already saved.	Numify reads your contacts so saved people show up by name instead of a number.
perm_notification_desc	Get spam and call alerts	Spam warnings and call alerts
perm_phone_desc	Identify incoming callers	Name callers as they ring
perm_overlay_desc	Show caller ID during calls	Caller details while you talk
perm_sheet_title	Turn on permissions	A few permissions to go
perm_sheet_subtitle	Caller ID, spam warnings and call history each need one permission to work.	Caller ID, spam alerts and call history each depend on one of these.
fsi_screen_title	See callers on your lock screen	Callers on your lock screen
fsi_screen_desc	Callora paints verified caller details over the lock screen the moment a call arrives.	The instant a call lands, Numify puts verified caller details on your lock screen.

12. Event logging (Stage 6)

Screen events already existed and now differ automatically, because the class names they are built from were renamed in 3b. The gap was permission outcomes.

Area	Status
screen_<class>	Already present in BaseActivity / BaseFragment; names changed via 3b
Ad show / type / fail-code	Already present in the monetize module
CALL_PHONE (recents shortcut)	ADDED - CallTimelineFragment
READ_PHONE_STATE (SIM info)	ADDED - SimInfoActivity
READ_CONTACTS (blocklist picker)	ADDED - BlockedNumbersFragment
READ_CALL_LOG (blocklist picker)	ADDED - BlockedNumbersFragment
RECORD_AUDIO (noise meter)	ADDED - NoiseMeterActivity
Generic priming launcher	ADDED - PermissionLauncher

13. Cleanup (Stage 7)

Unused resources found by iterating to a fixpoint over `R.<type>.x, @<type>/x` AND the `ViewBinding` class name - a scan without the binding check deletes live layouts.

Kind	Removed	Examples
drawable	103	bg_art_ring, bg_avatar_translucent, bg_bar, bg_block_method_chip, bg_bubble, bg_call_badge ...
layout	4	dialog_block_methods, include_block_methods, item_info_row, popup_blocklist_menu
raw	6	lottie_battery, lottie_caller, lottie_lookup, lottie_phone, lottie_shield, lottie_splash_loader
version catalog	0	46 libraries, 3 plugins - all in use

14. Dependency audit (Stage 8) - REPORT ONLY, nothing bumped

14 of 38 artifacts are current. Versions resolved live from Google Maven / Maven Central. No version was changed: an AGP, Firebase or OkHttp/Retrofit major bump can break in ways only a full release build reveals.

15. Deliberate exclusions and follow-ups

Read this before shipping.

Item	Why / what to do
34 ad-layout view IDs kept	AdMob and Meta native templates bind asset views by reference; renaming them breaks ad rendering, which no build can catch. Left as-is on purpose.
ic_launcher_* untouched	You have not supplied the Numify launcher icon or splash image yet - send the paths and these get resized to all five densities and wired in.
google-services.json is a placeholder	Replace with the real Firebase config for com.numify.callerid before any build you ship.
SDK credentials are blank	local.properties needs lighthouse.apiKey / baseUrl and lookup.apild / apiHash / apiToken. The build warns at configuration time while they are empty.
No release keystore	Callora's certificate/callora.jks was deliberately NOT copied. Generate a new key for Numify and set release.* in local.properties, or release builds stay unsigned.
Stage 5 (content de-duplication) skipped	Chosen at the outset. Asset JSON schemas, long template strings and raster art remain byte-identical to the source. Run Stage 5 if you need to beat content-hash detection.
Comment rewrite: long blocks done, short ones not	Comments were reworded rather than stripped, so the design rationale survives. All 182 blocks over 200 chars - where the distinctive prose lives - are rewritten, taking comment char-mass that matches the source from 100% to 55%. The remaining 45% is 1,139 short one-to-three-line comments; reword those too if you want the figure lower.
Instrumented tests not run	androidTest needs a device or emulator. The 5 JVM unit tests pass.
